This technical memorandum (TM) summarizes West Yost Associates (West Yost) hydraulic evaluation of the City of Santa Rosa’s (City) Pressure Zones R14 and R13, as it relates to the replacement of pumps at Stations S14 and S13. The City is planning to replace the two large 700 gallon per minute (gpm) pumps at Station S14 in order to meet the minimum required 1,500 gpm fire flow demand in this high fire severity zone (PZ R14). The City requested that West Yost develop system curves for Station S14 to assist in pump selection. Because PZ R14 is supplied from Pressure Zone R13 (PZ R13), the City also requested West Yost develop system curves for Station S13.

HYDRAULIC EVALUATION AND PUMP PERFORMANCE REQUIREMENTS

The most efficient method of developing a system curve for Station S14 and Station S13 is to run the City’s existing water system hydraulic model under both current and projected future demand scenarios. The hydraulic evaluation was performed using the City’s updated water model developed in 2007. Analyzing the water system under a range of operating conditions quickly provides the various operational conditions which must be met by the new pumps, creating a selection envelope for suitable pumps. The following sections discuss hydraulic model assumptions and methods used to establish pump performance requirements.

Pump Performance Requirements

Station S14 and Station 13 were evaluated using the City’s updated water model under existing system and future system demands. For each system condition, the pump station was modeled under both maximum head and minimum head conditions to develop system curves that bracket anticipated pump operation. Assumptions for the maximum and minimum head conditions, and fire flow conditions, are tabulated in Table 1.

\(^{(a)}\) City’s reservoir levels were based on July 2007 SCADA data.<br>\(^{(b)}\) SCWA’s reservoir levels were based on August and September 2007 SCADA data.
System Curves

To develop the system curves, all pumps at Stations S14 and S13 were closed, and flows were taken out at the suction side of the pump station and injected at the discharge side of the pump station. Minor losses for pump station piping were not included in the model.

Station S14

Figure 1 presents the system curves for Station S14. Because existing and future demands in PZR14 are smaller than the fire flow demand requirement for this pressure zone, the pumps should be selected and designed for maximum day demand plus fire flow demand conditions. Table 2 summarizes the system operational conditions at Station S14 used to bracket the system conditions shown previously on Figure 1.

After developing the system curves, for illustrative purposes only, West Yost used the Goulds manufacture pump selection applicator to identify two 800 gpm Goulds pump curves that operate within the given system curve conditions for Station S14. Figures 2 and 3 illustrate how these Goulds pump curves would meet the system curve requirements for Station S14.

Station S13

System curves for Station S13 are presented on Figure 4. Similar to PZR14, the existing and future demands in PZR13 are smaller than the fire flow demand requirement; therefore, the pump station should be selected and designed to be able to supply the maximum day demand plus fire flow demand conditions. In addition, because Station S13 also supplies water to Station S14, Station S13 should have the capacity to deliver 1,500 gpm of fire flow demand to Station S14 during a fire flow event in PZR14. Table 3 presents the system operational conditions at Station S13 used to bracket the system conditions shown on Figure 4.

After developing system curves for Station S13, again for illustrative purposes only, West Yost also looked into providing example pump curves from the Goulds manufacture pump selection applicator to identify two 800 gpm example pump curves that can operate within the given system curve conditions for Station S13. Figures 5 and 6 illustrate how these Goulds pump curves would meet the system curve requirements for Station S13.

Discharge pressures above 150 psi are shown in red.

Notes:

(a) Conditions / Assumptions for Existing System ADD Scenario:
- R13 Average Day Demand = 10 gpm
- SCWA Minimum Operating Level - Annadel Tank 1 = 24 feet (545 feet HGL)
- SCWA Minimum Operating Level - Annadel Tank 2 = 35.17 feet (551.17 feet HGL)
- Reservoir R13 Maximum Operating Level = 32 feet (839 feet HGL)
- S12 Pump Station Offline
- S14 Pump Station Offline
- Sonoma County Booster Pump Offline

(b) Conditions / Assumptions for Future System PHD Scenario:
- R13 Peak Hour Demand = 396.8 gpm
- SCWA Maximum Operating Level - Annadel Tank 1 = 34.28 feet (555.28 feet HGL)
- SCWA Maximum Operating Level - Annadel Tank 2 = 45.53 feet (561.53 feet HGL)
- Reservoir R13 Maximum Operating Level = 9.6 feet (1010.1 feet HGL)
- Reservoir R13 Minimum Operating Level = 12.8 feet (819.8 feet HGL)
- S12 Pump Station Offline
- One pump at S14 Online (724 gpm)
- Sonoma County Booster Pump Offline

(c) Conditions / Assumptions for Future System MDDFF Scenario:
- R13 Maximum Day Demand = 226.8 gpm
- Fire Flow Demand = 1,500 gpm (2.16 mgd)
- SCWA Maximum Operating Level - Annadel Tank 1 = 34.28 feet (555.28 feet HGL)
- SCWA Maximum Operating Level - Annadel Tank 2 = 45.53 feet (561.53 feet HGL)
- Reservoir R14 Minimum Operating Level = 9.6 feet (1010.1 feet HGL)
- Reservoir R13 Minimum Operating Level = 12.8 feet (819.8 feet HGL)
- S12 Pump Station Offline
- One pump at S14 Online (724 gpm)
- Sonoma County Booster Pump Offline
FINDINGS AND RECOMMENDATIONS

In summary, the results for these hydraulic evaluations indicate that each proposed pump at Station S14 and Station S13 would need to be sized at a minimum of 800 gpm design flow to meet fire flow requirements. A total of two identical, large pumps will be required to meet the total design capacity requirement.

Based on the hydraulic evaluation of the system curve, the two system conditions that bracket the pump selection are the existing system ADD and the future system PHD conditions. Note that for the existing system MDD plus fire flow conditions at Station S14, the total dynamic head at 1,500 gpm falls above the upper bracket. For Station S13, the future system MDD plus fire flow conditions falls below the lower bracket. The pumps selected for Stations S14 and S13 will need to meet the range of system conditions shown on Figures 1 and 4, respectively.
Figure 1. Pump Station S14 System Curves

Scenario 1: Maximum TDH Assumptions:
- Existing Average Day Demand:
  - R13 Existing Demand = 10 gpm
  - R14 Existing Demand = 16.3 gpm
- R14 Reservoir Maximum Operating Level:
  24 feet or 100% full (1024.5 feet HGL)
- R13 Reservoir Minimum Operating Level:
  12.8 feet or 40% full - Based on July 2007 SCADA data (819.8 feet HGL)
- S13 Pump Station offline

Scenario 2: Minimum TDH Assumptions:
- Existing Peak Hour Demand:
  - R13 Existing Demand = 35.1 gpm
  - R14 Existing Demand = 56.9 gpm
- R14 Reservoir Minimum Operating Level:
  9.6 feet or 40% full - Based on July 2007 SCADA data (1010.1 feet HGL)
- R13 Reservoir Maximum Operating Level:
  32 feet or 100% full (839 feet HGL)
- S13 Pump Station offline

Scenario 3: Fire Flow Assumptions:
- Existing Maximum Day Demand:
  - R14 Existing Demand = 32.5 gpm
- Fire Flow Demand:
  - Existing = 1,500 gpm (2.16 mgd)
- R14 Reservoir Minimum Operating Level:
  9.6 feet or 40% full - Based on July 2007 SCADA data (1010.1 feet HGL)
- R13 Maximum Operating Level:
  32 feet or 100% full (839 feet HGL)
- S13 Pump Station offline

Scenario 4: Maximum TDH Assumptions:
- Future Average Day Demand:
  - R13 Future Demand = 113.4 gpm
  - R14 Future Demand = 147.8 gpm
- R14 Reservoir Maximum Operating Level:
  24 feet or 100% full (1024.5 feet HGL)
- R13 Reservoir Minimum Operating Level:
  12.8 feet or 40% full - Based on July 2007 SCADA data (819.8 feet HGL)
- S13 Pump Station offline

Scenario 5: Minimum TDH Assumptions:
- Future Peak Hour Demand:
  - R13 Future Demand = 396.8 gpm
  - R14 Future Demand = 517.1 gpm
- R14 Reservoir Minimum Operating Level:
  9.6 feet or 40% full - Based on July 2007 SCADA data (1010.1 feet HGL)
- R13 Reservoir Maximum Operating Level:
  32 feet or 100% full (839 feet HGL)
- S13 Pump Station offline

Scenario 6: Fire Flow Assumptions:
- Future Maximum Day Demand:
  - R14 Future Demand = 295.5 gpm
- Fire Flow Demand:
  - Existing = 1,500 gpm (2.16 mgd)
- R14 Reservoir Minimum Operating Level:
  9.6 feet or 40% full - Based on July 2007 SCADA data (1010.1 feet HGL)
- R13 Maximum Operating Level:
  32 feet or 100% full (839 feet HGL)
