LOW-IMPACT DEVELOPMENT

OWNER’S MAINTENANCE GUIDE
WHAT ARE LID FEATURES & WHY DO WE NEED THEM?

In healthy natural areas, such as forests and grasslands, soil and vegetation act like a sponge, absorbing rainwater and slowly releasing it into creeks, aquifers, and the atmosphere. However, when natural areas are developed, the land’s ability to absorb and store rainwater is greatly reduced. Rain falling on impervious surfaces such as roofs, roads, parking lots, and driveways runs off faster and in greater amounts than it would under natural, pre-development conditions. Large quantities of fast-flowing storm water pick up pollutants such as motor oil, heavy metal dust, feces, fertilizers, and microplastics, and carry them through the storm drain system untreated directly to local creeks and the Russian River. These pollutants and the large quantity of runoff cause major issues for wildlife and public health.

Luckily, there are solutions that allow for necessary development without causing storm water issues. Low-Impact Development (LID) features are engineered landscape areas designed to capture and treat storm water runoff. They allow stormwater to slow down, spread out, and soak into the ground while filtering out pollutants. LID features are a requirement of any new development that creates or replaces more than 10,000 square feet of impervious surfaces. Aside from their hydrological benefits, LID features can be beautiful landscape additions that also provide valuable wildlife habitat.

Common examples of LID features include rain gardens, vegetated swales, bioretention planters, and permeable pavement. Let’s look at the two most common types of maintenance: vegetated features and permeable hardscaping. Look for factsheets on less common types of LID features at srcity.org/LID.

Correct long-term maintenance of LID features is critical to protect local water quality, groundwater supplies, public health, infrastructure, and wildlife.
LID PREVENTS COSTLY PROBLEMS

Roofs, parking lots, streets, and other impervious surfaces alter natural hydrology, increasing the volume and velocity of stormwater runoff. This has a variety of costly impacts including erosion, flooding, potholes, damage to structures, and wildlife habitat degradation. Well-designed and maintained LID features help prevent these issues and provide many other benefits as well.

Did you know that this:

Can contribute to this?:

- Filters out pollutants
- Replenishes groundwater supply
- Creates pollinator & bird habitat
- Beautifies urban areas
- Reduces flooding
- Prevents erosion

OWNERS’ RESPONSIBILITY

It is the property owner’s legal responsibility to maintain LID features so that they function as originally designed and approved. LID features are a condition of approval for qualifying development. Maintenance is required for the life of the development by the local California Regional Water Quality Control Board and the Environmental Protection Agency (EPA) under the Clean Water Act. This guide will help you stay in compliance.

Maintenance responsibility is attached to the property and transfers with changes in ownership.

INSPECTIONS & REPORTING

Typically, inspections will be performed annually by City staff. If corrective actions are needed, the property owner will be contacted. Corrective actions must be completed within the timeline specified by the City or prior to the first rain, whichever is sooner.

In some cases, depending on the type, age, and location of the feature, you may be asked to complete a “self-inspection” or have your feature serviced by a certified third-party contractor. If needed, City Staff will initiate and approve self-inspections. Self-inspections are typically a simple process that take just a few minutes per feature. City staff will send maps, a short inspection checklist, and instructions. Most homeowners can easily complete inspections themselves.
Vegetated LID features use **plants and special engineered soil** to absorb and filter storm water. Rain gardens, bioretention basins, and vegetated swales are common examples of vegetated LID features. They may be contained within a concrete barrier or may be a simple depression graded into the surrounding landscape. Vegetated features will have an inlet such as a curb cut, permeable pavement, or downspout that allows storm water to flow into the feature. Plants and engineered soil do the filtering. It is desirable for water to pond in the features for a short time, but it should drain within 72 hours to prevent mosquito breeding. In large rain events, storm water may reach the overflow drain and be distributed through pipes to an approved location.

### Residential Rain Garden

- **Native plants** absorb runoff and pollutants while attracting songbirds and butterflies.
- **Root zone** aids in nutrient uptake, microbial activity, and infiltration.
- **Gravel bed** (if needed)
- **Ponding zone** allows pollutants to settle and organic matter to accumulate.
- **Engineered soil mix**
- **Perforated pipe to outlet** (if needed)
- **Overflow structure** (if needed)
- **Rock/vegetated swale or pipe**
- **Gutter**

**ANOUNCE OF PREVENTION**

Regular maintenance of your LID feature will save money and time in the long run by helping prevent the need to do major restoration or replace the feature later. The maintenance recommendations in this guide will help you keep your LID feature in compliance & thriving.
GOOD MAINTENANCE

- Approved plants are diverse and healthy, providing habitat & filtration
- Vegetative cover is greater than 50%
- No weeds
- No sediment buildup
- Mulch is non-floatable

Image provided by the San Mateo Countywide Water Pollution Prevention Program
NON-COMPLIANT FEATURE

- Trash stored where it could spill into feature
- Sediment being washed into overflow drain
- Permeability modified without approval
- Abundant micro-trash
- Planted vegetation has largely failed, leaving less than 50% live vegetative cover

Image Credit: Kellen Johnston, City of Santa Rosa
DO...

✔ **Choose approved plants** from the current LID Manual Approved Plant List, found at: srcity.org/Low-Impact-Development

✔ **Maintain at least 50% vegetative cover** (weeds and trees don’t count!)

✔ **Use interlocking, rough-cut mulch** such as arbor or vineyard mulch that is less likely to float

✔ **Irrigate** plants as needed in dry season

✔ **Hand-pull weeds**

✔ **Clear inlets** of sediment, overgrown plants, and debris before the wet season to allow water to flow in

✔ **Clean out overflow drain**

DON’T...

✘ Change grade of LID feature or surrounding landscape

✘ Install plants not on the Approved List

✘ Let vegetative cover fall below 50%

✘ Allow regular foot traffic that may compress engineered soils

✘ Add large quantities of rock

✘ Use floatable mulch such as evenly cut wood chips or bark nuggets

✘ Allow sediment to build up

✘ Use herbicides

✘ Cut back desired vegetation too short or too often

**HEALTH & SAFETY TIP**
If you see standing water in your feature 72 hours after a rain event, check out msmosquito.org/services for mosquito abatement options.

</table>
Here are a few favorite species from the Approved Plant List. To increase habitat value and curb appeal in your LID feature, try using a variety of species including flowering plants. Plants in the low zone do most of the filtering, so you’ll want to make sure plantings are densest there. Find the Approved Plant List at srcity.org/LID.

FACTSHEET: PERMEABLE HARDSCAPING

Permeable hardscaping contains pores or separation joints that allow water to flow through into an infiltration bed of gravel or drain rock. Types of permeable pavement include porous asphalt and concrete, open joint or interlocking pavers, and plastic or concrete grid systems with gravel-filled or plant-filled voids. Permeable hardscaping can be found in parking lots, driveways, sidewalks, patios, or sometimes in street gutters as part of a vegetated roadside bioretention basin.

PREVENT CLOGGING

The most important maintenance for permeable hardscaping is keeping excess sediment out of the pore spaces. Keeping sediment from washing onto permeable hardscaping is the easiest form of preventative maintenance. Using a vacuum sweeper, which can either be a commercial truck or a smaller rented walk-behind unit, 1-2 times per year will clean out sediment before it causes major problems. If sediment is allowed to build up in the surface pores or below in the gravel bed to the point that it cannot be cleaned out, the feature may need to be replaced.

EXAMPLES

- Permeable Pavers
- Porous Concrete
- Regular Asphalt
- Porous Asphalt

INfiltration Bed (Compacted Layers Of Different Sized Gravel) Filters And Holds Water

Surface Pores Allow Water Through

Drainage Pipe (If Needed)
Pore space is clear of sediment and pavement has no runoff during low-intensity storms.

Roadside Bioretention features often have a strip of permeable pavement too.

Lots of sediment clogging pore spaces.
### DO...

- Prevent soil washout onto the pavement by maintaining landscaping areas adjacent to permeable hardscaping
- Clean up small amounts of sediment and leaves ASAP using a wet/dry vac
- Use a tarp under any landscaping materials that must be stored on permeable hardscaping, or store materials elsewhere
- Remove deeper sediment at least semi-annually using a rented walk-behind vacuum sweeper or a hired vacuum sweeper truck
- Clean inlets draining to the subsurface bed twice per year
- Prevent oil & automotive fluid drips

### DON’T...

- Use leaf blowers on permeable pavement, which can force dirt and debris into pavement void spaces
- Power wash permeable hardscaping unless it has just been vacuumed. Power washing can drive sediment deeper into voids
- Allow construction staging, soil/mulch storage, etc. on unprotected permeable hardscaping
- Allow sediment to build up
- Use herbicides to remove weeds
- Wash mud from your vehicle, tools, or other surfaces onto permeable hardscaping
- Repair vehicles on top of permeable hardscaping
### Annual Maintenance Recommendations

**Permeable Hardscaping**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
<th>How Often?</th>
<th>Ideal Season(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check adjacent landscaping for washout potential</td>
<td>If any bare spots or eroded areas are observed within nearby planted areas, they should be replanted/mulched/stabilized ASAP. If any washout does occur it should be cleaned off the pavement immediately to prevent further clogging of the pores.</td>
<td>as needed</td>
<td></td>
</tr>
<tr>
<td>Use a wet/dry vac (such as a shop vac) for quick cleanups</td>
<td>If you notice small amounts of sediment or leaves have been deposited on your permeable pavement, a quick cleanup using a household wet/dry vac can prevent bigger cleanups later.</td>
<td>as needed</td>
<td></td>
</tr>
<tr>
<td>Remove weeds</td>
<td>It is easiest to remove any weeds growing in the joints or pore spaces of your permeable hardscaping while they are still small.</td>
<td>2x/year</td>
<td></td>
</tr>
<tr>
<td>Remove deeper sediment with a commercial vacuum sweeper</td>
<td>For large areas, hire a commercial vacuum sweeper truck. For small areas, walk-behind vacuum sweepers are available for rent at some local equipment rental companies. Ensure that your machine uses vacuum action, not high-pressure air or water as this can drive sediment deeper. Grid pavers with large open spaces do not require vac sweeping.</td>
<td>1x/year in fall for low traffic areas 2+X/year for high traffic areas</td>
<td></td>
</tr>
<tr>
<td>Inspect/clean inlet structures draining to the infiltration beds</td>
<td>If there are curb cuts or pipes that bring water to your permeable hardscaping, check that they are clean. This will help prevent sediment buildup and save on cleaning later.</td>
<td>2x/year</td>
<td></td>
</tr>
<tr>
<td>Inspect/clean subdrain outlets (if applicable)</td>
<td>If your structure has subdrains, find the outlets and make sure they are not blocked.</td>
<td>1x/year</td>
<td></td>
</tr>
<tr>
<td>Test for permeability</td>
<td>If water is flowing across permeable pavement during low intensity storms or standing on the porous pavement 30 minutes after a rain event, it’s time for a deep clean.</td>
<td>1x/year</td>
<td></td>
</tr>
</tbody>
</table>

#### Resources for Maintenance of Permeable Hardscaping

For small installations, rented “walk-behind” vacuum units may prove most effective. Though these units can be loud and lack dust suppression, they are relatively easy to operate and inexpensive. Examples of effective walk-behind units include the Billy Goat models, the 5700 industrial-strength Scrubber by Tennant, and the sidewalk class vacuum sweepers made by Nilfisk, Advance and Hako. If walk-behind units are used, it is recommended that the scrub pressure be kept relatively low. The dirtiest areas may need to be power washed (<500 psi) after vacuuming.

For large areas, look for companies that provide parking lot cleaning services and use vacuum sweeper trucks such as the Elgin Whirlwind and the Allianz Model 650. Though much less effective than “pure” vacuum sweepers, regenerative air sweepers, such as the Tymco Model 210, Schwarze 348, Victory, and others, may be used. (Note: simple broom sweepers are not recommended for porous pavement maintenance.)
